[50] 1. For each of the languages L_1 and L_2 below, decide whether the language is Regular or not Regular. If Regular, give an FA that recognizes the language. If not Regular, use a fooling set argument to demonstrate that there is no FA that recognizes the language.

$$\begin{aligned} L_1 &= \{0^i 0^j \mid i, j \geq 0 \text{ and } i = j\} \\ L_2 &= \{0^i 1^j 0^k \mid i, j, k \geq 0 \text{ and } i = k\} \end{aligned}$$

The language L_1 is regular as it is recognized by the FA.

For the language $L_1 = \{0^i 0^j : i, j \geq 0 \text{ and } i = j\}$ we can simplify the set to just be $L_1 = \{0^i 0^i : i \geq 0\} = \{0^{2i} : i \geq 0\}$. Therefore we just have to distinguish between an odd and even number of 0's which this FA does.

L_2 is not regular.

Proof. We claim that $F = \{0^i : i \geq 0\}$ is a fooling set for L_2 . To see this we consider the two arbitrary distinct words $0^j, 0^n \in F$, we have for $m \geq 0$ that $0^j 1^m 0^j \in L_2$ but $0^n 1^m 0^j \notin L_2$ as $n \neq j$ this implies $0^j \not\equiv_{L_2} 0^n$. By **Lemma 4.2** we have L_2 is not regular \square

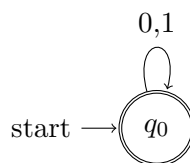

[50] 2. Textbook Problem 20, on Page 525, parts (a) and (b).

Prove or disprove:

(a) Every subset of a Regular language is Regular.

(b) There exists a non-Regular language L such that L^* is Regular.

Proof. (a) this is false Consider the language L_2 from problem 1 we have that L_2 is not regular. However consider the language $L'_2 = \{w \in \{0, 1\}^*\}$ we have that L'_2 is regular as it is recognized by the FA.

We have that $L_2 \subseteq L'_2$ but L_2 is not regular. Therefore we have a counter example to the claim. \square

Proof. (b) this is true \square
